**Sylodyn® NB**

**Material Data Sheet**

**Material**
- closed cellular polyurethane

**Colour**
- red

**Standard dimensions on stock**
- Thickness: 12.5 mm with Sylodyn® NB 12
- 25 mm with Sylodyn® NB 25
- Rolls: 1.5 m wide, 5.0 m long
- Stripes: max. 1.5 m wide, up to 5.0 m long

Other dimensions (also thickness) as well as stamped and molded parts on request.

**Area of application**

Further characteristic values on request

* Tests according to respective standards
** At form factor q=3

All information and data is based on our current knowledge. The data can be applied for calculations and as guidelines, are subject to typical manufacturing tolerances, and are not guaranteed. We reserve the right to amend the data.

Further information can be found in VDI Guideline 2062 - Page 2.
Load deflection curve

**Full surface bearing**

Form factor: $q=6$

[Diagram of Full surface bearing with load deflection curve]

**Strip bearing**

Form factor: $q=3$

[Diagram of Strip bearing with load deflection curve]

**Point bearing**

Form factor: $q=1.5$

[Diagram of Point bearing with load deflection curve]

Quasi-static load deflection curve measured at a velocity of deformation of 1% of the thickness per second; testing between flat steel-plates; recording of the 3rd loading; testing at room temperature
Modulus of elasticity

Form factor: q=6

Form factor: q=3

Form factor: q=1.5

Natural frequency

Form factor: q=6

Form factor: q=3

Form factor: q=1.5

Static modulus of elasticity as a tangent modulus taken from the load deflection curve; dynamic modulus of elasticity due to sinusoidal excitation with a velocity level of 100 dBv re. 5·10⁻⁸ m/s; test according to DIN 53513

Natural frequency of a single-degree-of-freedom system (SDOF system) consisting of a fixed mass and an elastic bearing consisting of Sylodyn® NB based on a stiff subgrade; parameter: thickness of elastomeric bearing
Vibration isolation - efficiency

Reduction of the transmitted mechanical vibrations by implementation of an elastic bearing consisting of Sylodyn® NB

Parameter: factor of transmission in dB, isolation rate in %

Creep behaviour

Increase in deformation under consistent loading

Parameter: permanent loading

Form factor: q=3

Dynamic E-modulus at long term loading

Change of dynamic modulus of elasticity under consistent loading (at 10 Hz)

Parameter: load duration

Form factor: q=3
Temperature dependency

- Frequency dependency
- Dependency on loading velocity
- Dependency on amplitude

**Temperature dependency**

- DMA test: Dynamic Mechanical Analysis; tests within linear area of the load deflection curve, at low specific loads.

**Frequency dependency**

- DMA test: mastercurve with reference-temperature of 21°C; tests within the linear area of the load deflection curve, at low specific loads.

**Dependency on amplitude**

- Preload at static load limit; form factor: g=3, thickness of material 25 mm.

**Dependency on loading velocity**

- Form factor: g=3, thickness of material 25 mm.
**Form factor**
The form factor is a geometric measure for the shape of an elastomeric bearing defined as the ratio of the loaded area and the area of sum of the perimeter surfaces.

Definition: \[ \text{Form factor} = \frac{\text{Loaded area}}{\text{Perimeter surface area}} \]

For a rectangular shape: \[ q = \frac{l \cdot w}{2 \cdot t \cdot (l+w)} \]

The form factor has an influence on the deflection and the static load limit respectively.

**Elastic Sylodyn®-bearings are considered as**
- Full surface bearing: Form factor > 6
- Strip bearing: Form factor between 2 and 6
- Point bearing: Form factor < 2

**Influence of the form factor on the deflection at the static load limit for a homogeneous material**
Reference value: Form factor \( q = 3 \)

**Influence of the form factor on the static load limit for a homogeneous material**
Reference value: Form factor \( q = 3 \)
